

## | 360° HAND GUARD |

To operators working with slitting tools every day, there is an increased risk of cutting or otherwise injuring their hands and fingers. It often happens that safety aspects are neglected for the sake of efficiency and productivity increase of man and machine.

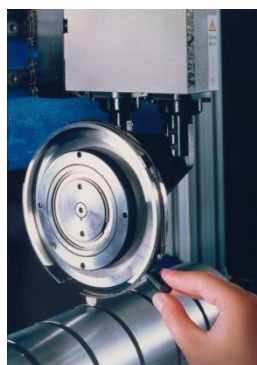

Knife holders equipped with the 360° Dienes safety hand guard have a movable safety element which releases the edge before the knife holder is activated and covers the edge completely again as soon as the slitting process is terminated.

This safety plus is achieved by means of a simple yet effective mechanism which utilises the vertical knife movement to perform the swivelling movement of the safety element.

Altogether this hand guard is a useful safety tool, the purchase of which should be considered by customers that intend to buy circular knife holders, in order to reduce the relatively high accident rate among users of slitting tools.

### **Benefits:**

- | reduction of labour slack caused by accidents
- | prevention of unintended engagement in the slitting unit
- | favourably priced
- | retrofittable to all current knife holders
- | in compliance with the accident prevention regulations
