

DIENES Slitting Cassettes for slit widths from 4 mm

A slitting cassette consists of several individual knife holders which are connected in an assembly with specified knife distance. Due to the modularity of these slitting cassettes they can be combined according to customer needs. When a different slit width is required the slitting cassettes can be exchanged quickly and easily.

The slitting cassettes are fitted into the machine either with a reception frame or our toolless “Quick Clamp” system.

As the cassettes are manufactured as complete units, the manufacturing tolerances that can be achieved are much more accurate and thus the tolerance addition is reduced considerably, i. e. can nearly be excluded.

Benefits at a glance:

- | smallest slit width from 4 mm
- | easier slit width change due to easy cassette exchange
- | lesser setup time compared to individual knife holders
- | exclusion of positioning errors (set slit width)
- | Due to optimized synchronism and smooth running of knives the danger of web tear is considerably reduced

We will be glad to retrofit your slitting machine with our slitting cassettes.
